Near surface plasma and vapor pressure (NSPVP) is a new advanced technique to enhance the enhancement of the response of heterogeneous catalytic reaction. In this work, NSPVP was used to enhance the ethylene polymerization reaction using an inner-wall-supported cobalt-based catalyst in a capillary packed bed reactor (CPBR) for the first time. CPBR can be operated at atmospheric pressure, which is beneficial to the mass transfer. The experiments demonstrated that NSPVP was efficient for the enhanced reaction rate. The simulation results revealed that the enhancement of the reaction rate was due to the increase of the mean concentrations of the reactant species near the surface of the catalyst. NSPVP improved the reactant diffusion coefficient inside the reactor as a result of the confinement of the plasma plasma within the inner wall of the capillary reactor. Q: Is this correct? If I want to express the following sentence, is this correct? The usual math subject course is taught right after O-level but this course will be taught after the subject of the course changes. Or, do I have to modify the original sentence like this: The usual math subject course is usually taught right after O-level but this course will be taught after the subject of the course changes. A: If I want to express the following sentence, is this correct? The usual math subject course is taught right after O-level but this course will be taught after the subject of the course changes. The sentence is unclear, partly because of the double negative. "No, this course will be taught after the subject of the course changes" is contradictory because it's a double negative. One option would be: The usual math subject course is usually taught right after O-level but this course will be taught later than the usual course. That may be easier to understand. Or, do I have to modify the original sentence like this: The usual math subject course is usually taught right after O-level but this course will be taught after the subject of the course changes. This is an improvement. Q: Understanding c++ overridden method that does exactly same as its superclass's implementation I'm working on
